Summary

Software developer with 6+ years experience building, owning, and maintaining mission-critical systems at the University of Saskatchewan. Progressed from UI maintenance and bug fixes to sole ownership of enterprise integrations, academic credential delivery infrastructure, and custom student system applications. Subject matter expert in university API systems and degree tracking applications; trusted resource for team leads and cross-team developers.

Education

University of Saskatchewan

B.Sc. Computer Science

Jun. 2019

Professional Experience

Programmer (Remote) - University of Saskatchewan

Oct. 2019 - Present

API & Data Pipeline Infrastructure

- Designed and implemented an API integration to connect the University to Canada's national credential network, enabling digital delivery of student transcripts, confirmation of enrollment and graduation documents, generating in excess of \$200K in annual revenue for the University.
- Designed and implemented an API-driven data pipeline to modernize and centralize the transfer of all 30,000+ students, faculty, and staff contact and identity data between student information systems and the University-wide data warehouse, replacing a legacy replication process and improving overall reliability.

Customer-Facing Applications

- Developed a Groovy/Grails web application from the ground up to help graduate committees track program progress for graduate students across the University, including CAS authentication integration and PDF upload support through a document management system API.
- Took full ownership of the University's Confirmation of Graduation application, including a rewrite to generate PDFs from XML and custom modifications to an embedded PDF library to enable future downstream functionality.
- Became owner of University's document management, academic advising, and degree audit systems; responsible for building customizations, ongoing bug resolution, and system upgrades; subject matter expert consulted by team lead and developers across multiple teams.

Legacy Systems, Maintenance, & Mentorship

- Mentored and onboarded two developers, accelerating their ramp-up on internal systems and development workflows.
- Authored technical documentation for APIs, integrations, and custom applications to improve maintainability and knowledge transfer.
- Resolved support issues for user-facing software by debugging and fixing defects, customizing student codebases, and delivering tailored software solutions for client requirements.

Skills

Technical: Java, Groovy, Python, Rust, Oracle SQL, Bash, HTML, CSS, Javascript, Springboot, Git, Docker, Amazon AWS

Soft: Problem-Solver, Team Player, Perseverant, Adaptable
